# OpBible – Technical Documentation

The code of the opbible.opm macro file is described here.

```
opbible.opm
3 \_codedecl \processbooks {OpBible: macros for creating annotated Bible}
4
5 \_message{This is OP-Bible, version <0.18 Jan 2023>}
```

# 1 Preparatory work

Loading packages.

```
opbible.opm

14 \_load[vlna] % single-letter prepositions and splitting hyphen managed specially in Czech

15 \_load[mte] % micro typographical extensions

16

17 \_namespace{opb}
```

Basic settings of T<sub>F</sub>X parameters.

Fonts.

Auxiliary macros. \.printwarn  $\{\langle text \rangle\}$  prints warning. \.sedef  $\{\langle name \rangle\} \{\langle body \rangle\}$  is expanded \sdef. \.myaddto  $\{\langle macro-name \rangle\} \{\langle text \rangle\}$  adds  $\langle text \rangle$  to  $\langle macro-name \rangle$  globally. Moeower it defines the undefined macro by \sdef. $\langle macro-name \rangle\} \{\langle text \rangle\}$ .

```
opbible.opm

67 \_let\.printwarn=\_opwarning

68 \_def \.sedef #1{\_ea\_edef \_csname#1\_endcsname}

69 \_long\_def\.myaddto#1#2{\_ifcsname#1\_endcsname

70 \_gobal\_ea\_addto\_csname#1\_endcsname{#2}\_else \_global\_sdef{#1}{#2}\_fi}
```

We prepare expandable if-macros:

```
\.isspacein \langle text \ \_iftrue is true if \langle text \rangle includes a space.
\.iscolonin \langle text \rangle : \_iftrue is true if \langle text \rangle includes a colon.
\.isdivisin \langle text \rangle -\_iftrue is true if \langle text \rangle includes a divis.

ophible.opm

79 \_def\.isspacein #1 #2\_iftrue{\_isempty{#2}\_iffalse}
80 \_def\.iscolonin #1:#2\_iftrue{\_isempty{#2}\_iffalse}
81 \_def\.isdivisin #1-#2\_iftrue{\_isempty{#2}\_iffalse}
```

# 2 The main loop over Bible books

The \processbooks macro does two loops over all marks in \printedbooks. The macro \printedbooks is a list of  $\langle a\text{-}marks \rangle$  of Bible books separated by spaces and it must be defined in the main file. The \\_useit trick is used here in order we want to add  $\langle space \rangle$ {} at the end of the expanded \printedbooks. The first loop body sets \pbook!  $\langle a\text{-}mark \rangle$  used for hyperlinks. The second loop body does:

- Defines \amark as  $\langle a\text{-}mark \rangle$  (an actual mark of the book used in the text).
- Defines \bmark as  $\langle b\text{-}mark \rangle$  (a mark of the book used in file names).
- Defines \.btit as the book title.
- Saves  $\langle a\text{-}mark \rangle$  to the \.currbook macro.
- Calls \.newbook{ $\langle a\text{-}mark \rangle$ }
- Prints title of the book to the terminal and to the log.
- Calls \bex!<a-mark> in order to apply the \BookException data.
- Inputs introduction file if it exists. The real \input and formatin of the introduction text is done by the \.printintro macro.
- Inputs format definition file if it exists. Information is saved to the TEX memory.
- $\bullet$  Inputs notes file if it exists. The notes are saved to the TeX memory.
- Calls \bpr!<a-mark> in order to apply the \BookPre data.
- Inputs txs file with original text of the Bible using \.bibleinput, i.e. prints the text from txs file with notes from the TeX memory.
- Calls \bpo!<a-mark> in order to apply \BookPost data.

Note that the macros \introfile, \fmtfile, and \notesfile give the location of aprropriate files and these macros must be defined by the user in the main file.

Note2: each book of the Bible is processed in the group. It means that all data from notes, formats etc. are stored in the memory only temporary for processing single book. After the Book is finalized, the TEX memory is freed.

We want <Fm 4> to be a link to Fm/1:4 because it is a single-chapter book. Compare <Gn 4> which is a link to Gn/4:1. There is a list of single-chapter books \nochapbooks. User must define it. The marks of these single-chapter books are separated by spaces here. The first and the last space are added to the \nochapbooks macro because we need them in \.brefBookChapter. The \.checknochapbooks macro does it, moreower, it checks if the \nochapbooks is defined. If not, it prints warning.

```

#### 3 Book titles

The macro \BookTile  $\langle a\text{-}mark \rangle$   $\langle b\text{-}mark \rangle$  {\langle title}\rangle declares titles of each Bible books. The  $\langle a\text{-}mark \rangle$  is an actual book mark used in printed text. The  $\langle b\text{-}mark \rangle$  can be used in file names as \bmark. The mapping is done here: \\def\\btit!\langle a\mark \rangle \langle title \rangle, \\def\\frac{f!}{a\mark} \langle \langle b\mark \rangle \langle b\mark \rangle \rangle \langle \langle b\mark \rangle \rangle \langle \langle b\mark \rangle \rangle \rangle \rangle \rangle \langle \rangle \rangl

The macro is defined as **\outer** because we don't want to see obscure errors due to missing a space after  $\langle b\text{-}mark \rangle$  or  $\langle a\text{-}mark \rangle$ .

```
opbible.opm 226 \_outer\_def\.BookTitle #1 #2 #3{\_sxdef{btit!#1}{#3}\_sxdef{f!#1}{#2}}
```

The \BookException  $\langle a\text{-}mark \rangle$  { $\langle code \rangle$ } macro adds the  $\langle code \rangle$  to the \bex!  $\langle a\text{-}mark \rangle$  macro. It is used in \processbooks loop in the group before files are read. You can redefine some filenames or something

more special here.

Macros \BookPre  $\langle a\text{-}mark \rangle$  { $\langle code \rangle$ } and \BookPost  $\langle a\text{-}mark \rangle$  { $\langle code \rangle$ } are defined similarly. They add  $\langle code \rangle$  to the \bpr! $\langle a\text{-}mark \rangle$  and to the \bpo! $\langle a\text{-}mark \rangle$  macros repectively.

opbible.opm

238 \\_outer\\_long\\_def\.BookException #1 #2{\.myaddto{bex!#1}{#2}}

239 \\_outer\\_long\\_def\.BookPre #1 #2{\.myaddto{bpr!#1}{#2}}

240 \\_outer\\_long\\_def\.BookPost #1 #2{\.myaddto{bpo!#1}{#2}}

241 \\_nspublic \BookTitle \BookException \BookPre \BookPost ;

The  $\code$  and  $\code$  and  $\code$  inserts  $\code$  before each chapter and after each chapter. The  $\code$  is the same for each chapter, it does not vary depending on the Book or Chapter number.

```
opbible.opm

250 \_long\_def\.ChapterPre #1{\_def\.chapbefore{#1}}

251 \_long\_def\.ChapterPost #1{\_def\.chapafter{#1}}

252

253 %\_outer\_def\ChapterPre {\.ChapterPre}

254 %\_outer\_def\ChapterPost {\.ChapterPost} % be done at the end of this file
```

#### 4 Actions

We create the output in two steps. First step: the data from  $\$  note etc. are read and saved to the  $T_EX$  memory. For each such data element the "action" is registered to a list of actions of the given verse. Each Bible verse has its list of actions. The second step: the Bible verses are read from a .txs file and all appropriate actions (registered to this verse) are processed before the verse text is printed. These actions can modify the selected parts of the verse text.

**\alist!**  $\langle full\text{-}vref \rangle$  is the list of actions associated with the verse  $\langle full\text{-}vref \rangle$ . The  $\langle full\text{-}vref \rangle$  is full reference to the verse in the format  $\langle book\text{-}mark \rangle / \langle chapter\text{-}num \rangle$ :  $\langle verse\text{-}num \rangle$ 

\.newaction{ $\langle full\text{-}vref\rangle$ }{ $\langle action\text{-}body\rangle$ } allocates new action.

```
opbible.opm

274 \_def\.newaction#1#2{%

275 \_unless\_ifcsname alist!#1\_endcsname \_sdef{alist!#1}{}\_fi

276 \_ea\_addto\_csname alist!#1\_endcsname{#2}%

277 }
```

A typical "action" is \.replpre. The actions are processed for each Bible verse when the verse text is saved to the \.buff macro. The \.buff macro is processed after all actions of given verse are done. \.replpre{\langle prefix\rangle} {\langle text\rangle} {\langle text\rangle} replaces first occurrence of  $\langle text\rangle$  by  $\langle prefix \rangle^{\sim} \langle text \rangle^{\sim}$  in \.buff macro. If the  $\langle text \rangle$  is empty then  $\langle prefix \rangle^{\sim}$  is inserted at the beginning of the \.buff. If  $\langle text \rangle$  does not exists then  $\langle fail \rangle$  is processed. It can report failed  $\langle text \rangle$  by the \.text macro.

```
opbible.opm
290 \_def\.replpre#1#2#3{%
   291
    293
294
      295
      \_else \.replsave ##1#1{#2}##2\_end \_fi
296
297
    \end{\end{\end}} \
    \_ea\.replpredo\.buff#2\_end
298
299
300 }
```

\.replprepost{ $\langle text \rangle$ }{ $\langle pre \rangle$ }{ $\langle post \rangle$ }{ $\langle fail \rangle$ } searches  $\langle text \rangle$  in \.buff and adds  $\langle pre \rangle$  before and  $\langle post \rangle$  after the  $\langle text \rangle$ . If the  $\langle text \rangle$  is not found then  $\langle fail \rangle$  is executed. The \.replprepost is used by \fmtins (with empty  $\langle pre \rangle$ ) because we want to insert the  $\langle post \rangle$  material directly.

```
opbible.opm

310 \_def\.replprepost#1#2#3#4{%

311 \_def\.replprepostdo##1#1##2\_end{%

312 \_ifx\_end##2\_end \_def\.text{#1}#4% <fail>

313 \_else \.replsave ##1#2#1#3##2\_end \_fi

314 }%

315 \_def\.replsave##1#1\_end{\_def\.buff{##1}}%

316 \_ea\.replprepostdo\.buff#1\_end

317 }
```

#### 5 The \Note macro

The first parameter of the \Note macro is  $\langle gen\text{-}vref \rangle$ . It is generalized reference to the Bible verse. It can be  $\langle chapter\text{-}num \rangle$ :  $\langle verse \rangle$  (the  $\langle book\text{-}mark \rangle$  is appended from the \.currbook macro) or  $\langle chapter\text{-}num \rangle$ :  $\langle verse\text{-}from \rangle$ - $\langle verse\text{-}to \rangle$  (only  $\langle verse\text{-}from \rangle$  is used for generating  $\langle gen\text{-}vref \rangle$ .\.\text{\constant} entoref \{\lambde gen\text{-}vref \rangle\} expands to  $\langle full\text{-}vref \rangle$ .

```
opbible.opm

332 \_def\.gentovref#1{\.currbook/\.gentovrefA#1-\end}

333 \_def\.gentovrefA#1-#2\end{#1}
```

\.renumvref  $\langle full\text{-}vref \rangle$ \\_relax does re-caclulating of  $\langle full\text{-}vref \rangle$  using \renum data.

opbible.opm

```
340 \_def\.renumvref #1/#2\_relax{#1/\_trycs{rn!\tmark!#1/#2}{#2}}
```

The  $\langle word \rangle$  given as a parameter of the \Note macro (see bellow) is used as a word phrase which should be be searched in the given verse text. This parameter  $\langle word \rangle$  is transformed first by expansion of \.transformword{\langle word \rangle} to the \langle tword \rangle variant and the \langle tword \rangle is actually used for searching. The \.transformword{\langle word \rangle} expands to the variant of the \langle word \rangle declared by \.vdef. If not declared then it expands to the \langle word \rangle itself, i.e \langle tword \rangle is equal to \langle word \rangle in this case.

```
opbible.opm

351 \_def\.transformword#1{%

352 \_ifcsname v!\tmark!#1\_endcsname \_lastnamedcs

353 \_else #1\_fi

354 }
```

**\Note**  $\langle gen\text{-}vref \rangle$   $\langle space \rangle$  { $\langle word \rangle$ }  $\langle text \rangle$  \par transforms  $\langle word \rangle$  to the  $\langle tword \rangle$  (see above), saves  $\langle text \rangle$  and activates replace-action of  $\langle tword \rangle$  to \.doNote{ $\langle note\text{-}num \rangle$ }{ $\langle tword \rangle$ } in given verse.

There is an alternative syntax  $\ensuremath{\mbox{Note}\mbox{\sf gen-vref}\mbox{}} \langle \ensuremath{\mbox{\it k}} \mbox{\it word} \rangle \} = \{\langle pword \rangle\} \langle \ensuremath{\mbox{\it k}} \mbox{\it vext} \rangle \$  is given then it is printed in the note instead  $\langle tword \rangle$ . More precisely: transformed  $\langle word \rangle$  is used for searching (and it is kept in the verse unchanged) but  $\langle pword \rangle$  is printed in the note.

The \ww can precede \Note. If it is true then the  $\langle word \rangle$  is prepared in \.nextww and  $\langle pword \rangle$  is in \.nextwwA. Otherwise, the macros \.nextww and \.nextwwA are undefined.

\Note does exactly following:

- Calculates  $\langle full\text{-}vref\rangle$  using \.gentovref{ $\langle genv\text{-}ref\rangle$ } and svese it to \.fullvref.
- If the verse number of  $\langle full\text{-}vref\rangle$  is zero, we want to insert the note-text before the chapter. This is one by the \.NoteB macro.
- Allocates new  $\langle note-num \rangle$ , i.e. \.notenum is  $\langle note-num \rangle$ .
- Modifies  $\langle full\text{-}vref \rangle$  if \renum was declared using \.renumvref and saves the result to \.fullvrefm.
- Uses \.nextww and \.nextwwA as  $\langle tword \rangle$  and  $\langle pword \rangle$  if they are defined.
- Otherwise transforms  $\langle word \rangle$  to  $\langle tword \rangle$  by \.transformword.
- Reads  $\langle pword \rangle$  (word to be printed in the note) by \.NoteA if the alternative syntax with ={ $\langle pword \rangle$ } is used. Else  $\langle pword \rangle$  is equal to  $\langle tword \rangle$ . Use it only if \.nextww is undefined.
- Defines \notetext!  $\langle note-num \rangle$  as  $\langle text \rangle$ .
- Defines  $\noteref! \langle note-num \rangle$  as  $\langle full-vref \rangle$  re-calllated by  $\noteref!$
- Defines \notepre!  $\langle note-num \rangle$  as numeric part of modified  $\langle full-vref \rangle$ . and calculates  $\langle from \rangle \langle to \rangle$  part (if exists in  $\langle gen-vref \rangle$ ) using \.renumlabel macro. This is printed prefix of the \Note.
- Defines \pword!  $\langle note-num \rangle$  as  $\langle pword \rangle$ ,
- Does \.newaction{ $\langle full\text{-}vref\rangle$ }{\.replpre{\.doNote} $\langle note\text{-}num\rangle$ }} { $\langle tword\rangle$ }{\.notefail{ $\langle note\text{-}num\rangle$ }}}.

This is done by  $\land AddNote\{\langle full\text{-}vref\rangle\}\{\langle note\text{-}num\rangle\}\{\langle tword\rangle\}.$ 

Note that \Note is defined as \outer in order to report correctly typical mistakes with missing empty line the text of a previous \Note.

455 \_def\.isversezero#1/#2:#3\_iftrue{\_ifnum #3=0 }
```

\.renumlabel \langle full-vref \\\_relax expands to the numeric part of \langle full-vref \rangle and appends the  $--\langle to \rangle$  part if the \.tmp macro is in the format  $\langle chapter \rangle$ :  $\langle from \rangle - \langle to \rangle$ . The  $\langle to \rangle$  part is re-calculated in order to the the number of verses between  $\langle from \rangle$  and  $\langle to \rangle$  be kept. If the  $\langle to \rangle$  part is in the format  $\langle chapter \rangle$ :  $\langle verse \rangle$  then it is unchanged. The \.renumlabel macro must be expandable, so we cannot use \isinlist and we prepare special expandable macros \.isdivisin and \.iscolonin.

```
opbible.opm

```

The \Note text is processed and printed in the second step, when the .txs file is read. Actions are assigned to each verse and they are run before the appropriate verse is printed. And \Note action says:

```
\.replpre{\.doNote{<note-num>}}{<tword>}{\.notefail{<note-num>}}
```

It means that the  $\langle tword \rangle$  is searched in the verse text and replaced by \.doNote{ $\langle note-num \rangle$ }{ $\langle tword \rangle$ }. If  $\langle tword \rangle$  is not found then \.notefail{ $\langle note-num \rangle$ } prints warning about it and \.doNote{ $\langle note-num \rangle$ }{} is prefixed before the verse text.

```
opbible.opm

488 \_def\.notefail#1{%

489 \.printwarn{\_csstring\\Note: \.currverse: The text "\_unexpanded\_ea{\.text}" not found}%

490 \.replpre{\.doNote{#1}}{}}% \Note is registered with the beginning of the verse

491 }
```

The \.doNote{ $\langle note-num \rangle$ }{ $\langle tword \rangle$ } prints the real note text in the second step, when the verse text from \.buff is processed.

The  $\langle chapter \rangle$ :  $\langle verse \rangle$  is printed from  $\backslash notepre!$  only if it differs from previous one, i.e. from  $\backslash prevnotepre$ . The  $\langle pword \rangle$  is printed with uppercase first letter by  $\backslash prevnotepre$  and with appended dot, but the dot is not printed if the  $\langle pword \rangle$  ends by ? or !.

opbible.opm 503 \\_def\.prevnotepre{} 504 \\_def\.doNote#1#2{% \\_edef\.tmpb{\\_cs{notepre!#1}}% 505  $\label{local_space} $$\sum_{\text{space }\notellog(\space \space \spac$ 506 507 \.noteinsert{% {\\_bf \\_ifx\.prevnotepre\.tmpb \\_else \.tmpb \\_enskip \\_glet\.prevnotepre=\.tmpb \\_fi 508 \.trymakedest{n:\\_cs{noteref!#1}}% 509 510 \\_edef\.tmpb{\\_csname pword!#1\\_endcsname}% \\_ifx\.tmpb\\_empty \\_else 511 \\_addto\.tmpb{.}\.punctpword 512 513 \\_ea\.upcasefirst \.tmpb\\_space \\_fi 514 515 }% end of \bf \\_cs{notetext!#1}}% 516 517 {\notecolor#2}% 518 } 519 \\_def\\_printfnotemark{} 520 \\_def\\_textindent#1{\\_noindent}

The  $\langle pword \rangle$  is typically all lowercase. But we want to capitalize the first letter of the  $\langle pword \rangle$  when printing by \.upcasefirst. You can say \let\.upcasefirts=\relax if you don't want this feature.

```
opbible.opm
530 \_def\.upcasefirst #1{\_uppercase{#1}}
```

The dot is added to  $\langle pword \rangle$  when it is printed. But if  $\langle pword \rangle$  ends by ! or ? then the added dot is uggly. We have to correct it in the \.punctpword macro. Note that  $\langle pword \rangle$  is saved to \.tmpb.

```
opbible.opm 538 \_def\.punctpword{\_replstring\.tmpb{!.}{!}\_replstring\.tmpb{?.}{?}}
```

When \Note has empty parameter  $\langle word \rangle$  (i.e.  $\langle tword \rangle$ ) then it is anchored to the beginning of the verse. Moreower, if there are more such Notes referenced to the same verse then we merge all such notes to single note. So \.doCNote{ $\langle notenum \rangle$ } is run from \.prebuff and it only adds the text of the note to the \.Cnotetext buffer. When \.prebuff is completed then \.printCnote prints the merged note.

```

\.reducetword does nothing by default. But \megrednotes re-defines it, so all \Notes are referenced to the beginning of the verse and nothing is searched. The \Notes with the same verse are merged in this case using \.doCNote.

```
opbible.opm
576 \_def\.reducetword{}
577 \_def\.mergednotes{\_def\.reducetword{\_def\.tword{}}}
578 \_nspublic \mergednotes ;
```

Because there is asynchronous processing of the \Note text, we have a problem when an error occurs here. We cannot reference to appropriate line where the \Note is written. So, we print the parameters of processed \Note to the log file. The user can look into this file and the last printed \Note parameters here refers probably to the \Note where the reason of the error is.

The logging is done by  $\. notelog{\langle text \rangle}$ . It is  $\wlog$  by default but you can set it to  $\ignoreit$  or  $\wterm$ .

```
opbible.opm
591 \_let\.notelog=\_wlog
```

# 6 Inserting data from format files

```
\fmtpre \{\langle gen-vref\}\{\langle khat\}\ \adds \langle what\rangle \to \.fmtprebuff, i.e. at the beginning of the verse. \fmtmadd \{\langle gen-vref\}\{\langle khat\rangle \}\ \adds \langle what\rangle \tau \.buff, i.e. at the end of the verse. \fmtins \{\langle gen-vref\}\{\langle text\rangle \}\ \adds \langle what\rangle \text\rangle \text\rangle
```

All these commands allocate new action using \.newaction.

\.addpre\macro{ $\langle text \rangle$ } adds the text to the macro before its original contents.

\.printverse prints verse from \.currversenum and (possibly changed) \.buff. It prints the single raised verse number first.

\.printbeforefirst is a macro which is executed just before first verse of the chapter, after all material from \fmtpre is executed. I.e after printing a chapter name (if declared by \fmtpre).

The \.fmtprebuf includes \ind command from \fmtpoetry if the verse should be indented at its begin before the verse number. The verse number is shifted up and it is in an \hbox or it is llapped in the poetry environment, more exactly immediately after \ind is used. The \.hboxorllap macro does this game.

```

#### 8 Bible references

The < will be set to active as character equivalent to the macro  $\land$ .bref $\langle text \rangle >$ . This macro does all job with the hyperlinks. Fist of all, it scans the parts of the  $\langle text \rangle$  and saves them to

- \.ltextP ... the text before a link specification (given in "...")
- \.ltextB ... the book mark followed by ~

```
\.ltextC ... the chapter number followed by:
\.ltextV ... the verse number
\.ltextS ... sub-verse identifier (a if there is a verse 4a)
\.ltextF ... the -- if the ⟨from⟩-⟨to⟩ format is given
\.ltextN ... the ⟨to⟩ part from the ⟨from⟩-⟨to⟩ format.
```

All these macros above can be empty if the appropriate part of the scanned  $\langle text \rangle$  is missing. The \.linkpre macro includes v if it is verse link, includes n if it is note link and g if it is gloss link. These macros will be converted due to \renum data (if needed) and printed by \.linktext.

899 \_def\.ltextCin #1:#2/{\_iprelinkC:\_immediateassignment\_let\.ltextCin=\.ltextCin}
900 \_let\.ltextCin=\.ltextCin
```

\.prelinkB is \langle book-mark \rangle of last referenced book. \.prelinkC is \langle chapter-num \rangle of last referenced chapter. They are used if the reference is not full. They are initialized at the beginning of books and chapters and they are changed locally in the \Note text. If the \< is used then they are re-initialized.

```
910 \_def\<{\_let\.prelinkB=\.currbook \_let\.prelinkC=\.currchapnum \_let\.prelinkV=\.currversenum \.bref}
```

Macro \.brefL recalculates \.linkfspec and \.linktext due to \renum data and creates the link \.linkpre:\.linkfspec with the text \.linktext.

 $\.$ renumlinktext  $\langle full-vref-ori\rangle$ \_relax $\langle full-vref-modified\rangle$ \_relax does re-calculation of the parts of the  $\.$ linktext macro.

The \.linkfspecone solves situation when chapter is given but no verse number: we must set the verse number to 1.

If the link destination is article, then the  $\langle full\text{-}vref\rangle$  has reduced format  $\langle book\rangle/\langle chapter\rangle$ . If the link destination is itroduction then the  $\langle full\text{-}vref\rangle$  has more reduced format:  $\langle book\rangle/\langle chapter\rangle$ .

If the book mark is declared by \vdef then the printed version of the book mark is transformed depending on the current \tmark. This is done by the the \.newlinkB macro.

\.linklog  $\{\langle text \rangle\}$  macro prints logging info of the link in the format

```
<\langle link\text{-}spec \rangle> = [\langle full\text{-}vref \rangle] \{\langle printed\text{-}link \rangle\}
```

\.linklog is \wlog by default and when \tracinglinks is set. It is \ignreit when \notracinglinks is set. You can set it to \wterm if you want.

\ww { $\langle phrase-A \rangle$ } { $\langle phrase-B \rangle$ } ... has the same number of parameters as \vdef. They are separated by spaces. Each parameter can be in the "single form", i.e. { $\langle phrase-A \rangle$ } or in the "extended form", i.e. { $\langle phrase-A \rangle$ } ={ $\langle printed-A \rangle$ }. The macro searchs the correct phrase (given by the \.varnum) and saves it to the \.nextww. The \.nextwwA is set to \.nextww if there is single form of the parameter else \.nextwwA is  $\langle printed-A \rangle$  part of the parameter in the extended form. These macros are used in the next \Note where they are re-set to \undefined meaning.

1273 \_dimen\.noteins=\_maxdimen  % full page of notes allowed
```

The \.noteinsert  $\{\langle text \rangle\}$  inserts its parameter to the \.noteins. We open the \insert and set basic parameters using \.noteset. Then the empty box with strut height is inserted in vertical mode (in order to consecutive notes have good baselineskip between them). Then the  $\langle text \rangle$  is printed and the paragraph is finalized. The empty box with strut depth is appended after the paragraph (in order to the same reason). Final \penalty0 allows breaking between notes.

```

```

We add macros for inserting two columns of notes from \.noteins into the page. First, we add \noterule with the space given by \skip\.noteins. The \.noteins material is prefixed by \penalty0 (in order to allow the next \vsplit operation) and the \vfil is added (in order to the case when the second column is smaller than the first one). The \splittopskip is set and first \vsplit toOpt adds skip given by \splittopskip to the \.noteins. The \\_balancecolumns from OpTeX for splitting to two columns is used. We need to set \\_Ncols, \\_dimenO and \\_box6 before running \\_balancecolumns. We need to insert \vskip\splittopskip because \\_balancecolumns supposes that the typesetting point resides at

the first baseline of the columns.

The final \vskip does "raggedbottom". We need to add 1fill1 in order to suppress the \vfill from the \end algorithm. We add minus6pt because the height of two columns can be by half-line higher than the insertion algorithm excepts (in the case with odd lines before splitting to the two columns).

## 12 Inserting images over two pages

We can insert an image at the bottom of the page which spans from even to odd page. The macro  $\insertSpanImage\{\langle Title\rangle\}\ [\langle label\rangle]\ (\langle params\rangle)\ \{\langle image\ file\rangle\}\ does\ it.$  The image is placed at the bottom of the pages using following rule: if the  $\insertSpanImage\ occurrs\ at\ the\ current\ page\ c$  then

- if c is even and the image height fits to the current page then the image is inserted to pages c, c+1,
- if c is even and the image height doesn't fit to the current page then the image is inserted to pages c+2, c+3,
- if c is odd then the image is inserted to pages c+1, c+2.

The macro \insertSpanImage saves the image in the box \.spanpicbox. The \\_picwidth of the image is calculated as  $2*(\new margin)$ . I.e. when we put the box to the page firstly then only the left half of its size is printed.

Next, \insertSpanImage checks if the current page is even. If it is true and if there is sufficient space \pagegoal-\pagetotal at the current page, the image is inserted to the current page using the \.startinsertSpanImage which runs \.insertBot in fact. The second part of the image is printed because \\_endoutput (processed at the end of the output routine where first part of the image is inserted) runs \.addpicbox. The \.addpicbox runs second \.insertBot which is printed on the next page.

If the current page is odd, then \insertSpanImage doesn't run \.startinsertSpanImage immediatelly, but \\_endouput inserts first part of the image using \.inspicbox which is equal to \.inspicboxafter in this case. It processes \.startinsertSpanImage which inserts the first part of the image on the next page (even) page.

If the current page is even but the image cannot fit to the current page then the delay using \\_endoutput is activated too. But the \.ispicboxafter checks that the current page is even and it does nothing in this case. Next page is ofdd, so \.ispicboxafter invoked by next \\_endinput inserts the first part of the image which will be printed on the next (even) page.

```

The \.lqqbox and \.rqqbox include the graphical marks for quotations. First one is used at the left pages, second one at the right pages.

The macro  $\quotedby{\langle author\rangle}$  puts the author of the quatation to the next line. The macro  $\quotedbyright$  (which is used at left pages) prints the  $\langle author\rangle$  at the last line if there is sufficient space.

The following macros Cite,  $\insertCite$  and  $\swapCites$  are used for insertion of citations to the two-cloumn printed articles. The  $\insertCite\langle label\rangle\{\langle text\rangle\}\$  simply saves the  $\langle text\rangle$  to the macro  $\c.!\langle article-num\rangle!\langle label\rangle$ . The  $\insertCite\langle label\rangle\langle feft-or-right\rangle$  inserts the citation declared by  $\insertCite\langle label\rangle$  to the text using  $\insertCite\langle label\rangle$ . The variant  $\insertCite\langle label\rangle$  is processed or ignored. This depends on the parity of the current page, which is restored from .ref file and saved to the macro  $\insertCite\langle label\rangle$ .

\insertBot  $\{\langle title \rangle\}$  [\langle label\rangle] (\langle params\rangle) \{\langle data \rangle}\) inserts a material from \langle data \rangle\) to the bottom of the current page or next page if it is unable to fit to the current one. The material is titled by \langle title \rangle\) and it can be referred by \langle label\rangle. The \langle params\rangle\) can inclue a special setting used locally for the priting of this material.

\putBot \langle chapter \rangle : \langle verse \rangle \langle (title \rangle) \ [\langle label \rangle] \ (\langle params \rangle) \ \{\langle data \rangle}\) behaves like \insertBot, but the result is printed to the bottom of the page where the verse \langle chapter \rangle : \langle verse \rangle is, or to the next page if the material is unable to fit to the current one.

Insertions objects over pictures (maps)

 $\t vert (x-pos) \ (y-pos) \ \{(text)\}\$  behaves like  $\t vert \$  from OpTeX, but moreover, it inserts a "white shadow" as a background of the text. It can be used as text printed over a pictures (maps etc.).  $\t vert \$  creates an  $\t vert \$  with "white shadow" as background.

\shadowparameter is a number of "transparency amount" used for "white shadows". User can re-define it but it must be done before first usage of \putstext or \shadowedtext and it is used for whole document.

#### 14 Chiasm

The pair \begChiasm...\endChiasm defines chiasm environemnt. It behaves like \begitems...\enditems, but you can use given number of \* which denotes the indentation level. The letters A, B, C, etc. will be prefixed automatically and when you are in the backward phase then C', B', A' are prefixed. You can try:

```
\begChiasm
* Předkové a rané zkušenosti (\<11:10-12:9>)
** Rané kontakty s ostatními národy (\<12:10-14:24>)
*** Smlouva s Bohem (\<15:1-17:27>)
** Pozdní kontakty s ostatními národy (\<18:1-21:34>)
* Potomci a smrt (\<22:1-25:18>)
\endChiasm
```
