43 \def \sedef #1{\_ea\_edef \_csname#1\_endcsname}
```

### 2 Actions

We create the output in two steps. First step: the data from  $\$  note etc. are read and saved to the  $T_EX$  memory. For each such data element the "action" is registered to a list of actions of the given verse. Each Bible verse has its list of actions. The second step: the Bible verses are read from a .txs file and all appropriate actions (registered to this verse) are processed before the verse text is printed. These actions can modify the selected parts of the verse text.

 $\alist!\langle full\text{-}vref\rangle$  is the list of actions associated with the verse  $\langle full\text{-}vref\rangle$ . The  $\langle full\text{-}vref\rangle$  is full reference to the verse in the format  $\langle book\text{-}mark\rangle/\langle chapter\text{-}num\rangle$ : $\langle verse\text{-}num\rangle$ 

```
op-bible.opm

61 \def\newaction#1#2{%

62 \unless\ifcsname alist!#1\endcsname \sdef{alist!#1}{}\fi

63 \ea\addto\csname alist!#1\endcsname{#2}%

64 }
```

A typical "action" is **\replyre**. The actions are processed for each Bible verse when the verse text is saved to the **\tmpb** macro. The **\tmpb** macro is processed after all actions of given verse are done.  $\mathbf{prefix}$   $\{\langle fail \rangle\}$  replaces first occurrence of  $\langle text \rangle$  by  $\langle prefix \rangle$  in **\tmpb** macro. If the  $\langle text \rangle$  is empty then  $\langle prefix \rangle$  is inserted at the beginning of the **\tmpb**.

If  $\langle text \rangle$  does not exist then  $\langle fail \rangle$  is processed. The  $\langle fail \rangle$  macro can use \text where  $\langle text \rangle$  is saved.

```

### 3 The \Note macro

The first parameter of the \Note macro is  $\langle gen\text{-}vref \rangle$ . It is generalized reference to the Bible verse. It can be  $\langle chapter\text{-}num \rangle$ :  $\langle verse \rangle$  (the  $\langle book\text{-}mark \rangle$  is appended from \CommentedBook token list) or  $\langle chapter\text{-}num \rangle$ :  $\langle verse\text{-}from \rangle$ - $\langle verse\text{-}to \rangle$  (only  $\langle verse\text{-}from \rangle$  is used for generating  $\langle gen\text{-}vref \rangle$ . \Genevalue \Qenoverf\rangle \text{equiv} environments \( (full\)-vref\rangle.

```
op-bible.opm

101 \def\gentovrefA#1-#2\end{#1}
```

\renumref  $\langle full\text{-}vref\rangle$ \relax does re-calculating of  $\langle full\text{-}vref\rangle$  using \renum data.

op-bible.opm

```
107 \def\renumvref #1/#2\relax{#1/\trycs{rn!\tmark!#1/#2}{#2}}
```

The  $\langle word \rangle$  given as a parameter of the \Note macro (see bellow) is used as a word phrase which should be be searched in the given verse text. This parameter  $\langle word \rangle$  is transformed first by expansion of \transformword{\langle word \rangle} to the \langle tword \rangle variant and the \langle tword \rangle is actually used for searching. The \transformword{\langle word \rangle} expands to the variant of the \langle word \rangle declared by \wdef. If not declared then it expands to the \langle word \rangle itself, i.e \langle tword \rangle is equal to \langle word \rangle in this case.

```

```

\Note  $\langle gen\text{-}vref \rangle$   $\langle space \rangle$  { $\langle word \rangle$ }  $\langle text \rangle$  \par transforms  $\langle word \rangle$  to the  $\langle tword \rangle$  (see above), saves  $\langle text \rangle$  and activates replace-action of  $\langle tword \rangle$  to \doNote{ $\langle note\text{-}num \rangle$ }{ $\langle tword \rangle$ } in given verse. There is an alternative syntax \Note  $\langle gen\text{-}vref \rangle$   $\langle space \rangle$  { $\langle word \rangle$ }={ $\langle pword \rangle$ }  $\langle text \rangle$  \par If  $\langle pword \rangle$  is given then is is printed in the note instead  $\langle tword \rangle$ . More precisely: transformed  $\langle word \rangle$  is used for searching (and it is kept in the verse unchanged) but  $\langle pword \rangle$  is printed in the note. \Note does exactly following:

- Allocates new  $\langle note-num \rangle$ ,
- Transforms  $\langle gen\text{-}vref \rangle$  to  $\langle full\text{-}vref \rangle$  using \gentovref.
- Modifies \(\langle full-vref \rangle \) if \renum was declared using \renumvref and saves the result to \fullvrefm.
- Transforms  $\langle word \rangle$  to  $\langle tword \rangle$  (to be searched and printed) by \transformword.
- Reads  $\langle pword \rangle$  (word to be printed in the note) if the alternative syntax with ={ $\langle pword \rangle$ } is used. Else  $\langle pword \rangle$  is equal to  $\langle tword \rangle$ .
- Defines \notetext!  $\langle note-num \rangle$  as  $\langle text \rangle$ .
- Defines \noteref!  $\langle note-num \rangle$  as  $\langle full-vref \rangle$ .
- Defines \notepre!  $\langle note-num \rangle$  as numeric part of modified  $\langle full\text{-}vref \rangle$  and calculates  $\langle from \rangle$ - $\langle to \rangle$  part (if exists in  $\langle gen\text{-}vref \rangle$ ) using \renumlabel macro. This is printed prefix of the \Note.
- Defines \pword!  $\langle note-num \rangle$  as  $\langle pword \rangle$ ,
- Does

The \Note text is processed and printed in the second step, when the .txs file is read. Actions are assigned to each verse and they are run before the appropriate verse is printed. And \Note action says:

```
\replpre{\doNote{<note-num>}}{<tword>}{\notefail{<note-num>}}
```

It means that the  $\langle tword \rangle$  is searched in the verse text and replaced by  $\doNote{\langle note-num \rangle}{\langle tword \rangle}$ . If  $\langle tword \rangle$  is not found then  $\doNote{\langle note-num \rangle}{}$  prints warning about it and  $\doNote{\langle note-num \rangle}{}$  is prefixed before the verse text.

```
op-bible.opm

```

The phrase  $\{\langle word \rangle\}$  used in notes must be exactly the same as the word used in the .txs text. But we want to capitalize the first letter of the  $\langle word \rangle$  when printing. You can say \let\upcasefirts=\relax if you don't want this feature.

```
op-bible.opm
249 \def\upcasefirst #1{\uppercase{#1}}
```

Because there is asynchronous processing of the \Note text, we have a problem when an error occurs here. We cannot reference to appropriate line where the \Note is written. So, we print the parameters of processed \Note to the log file. The user can look into this file and the last printed \Note parameters

here refers probably to the \Note where the reason of the error is.

```
262 \let\notelog=\wlog
```

## 4 Inserting data from format files

 $\label{eq:linear_continuous_section} $$ \int ds \langle what \rangle $ to \tmpc, i.e. at the beginning of the verse. $$$ 

 $\mathsf{ftmadd} \{(gen\text{-}vref)\}\{(what)\}\}\$  adds (what) to  $\mathsf{tmpb}$ , i.e. at the end of the verse.

\fmtins  $\{\langle gen\text{-}vref\rangle\}\{\langle text\rangle\}\{\langle what\rangle\}\$  inserts  $\langle what\rangle$  after  $\langle text\rangle$  in the verse. If  $\langle text\rangle$  is not found then  $\langle what\rangle$  is inserted like \fmtpre does it

All these commands allocate new action using \newaction.

```
op-bible.opm

275 \let\FormatedBook=\CommentedBook

276 \def\fmtpre#1#2{\newaction{\gentovref{#1}}{\addto\tmpc{#2}}}

277 \def\fmtadd#1#2{\newaction{\gentovref{#1}}{\addto\tmpb{#2}}}

278 \def\fmtins#1#2#3{\newaction{\gentovref{#1}}{\replpre{\fmtafter{#3}}{#2}{\fmtfail{#3}}}}

279 \def\fmtafter#1#2{#2#1}

280 \def\fmtfail#1{\fmtwarn\addto\tmpc{#1}}

281 \def\fmtwarn{\printwarn{\string\fmtins: \currverse: The text "\unexpanded\ea{\text}" not found}}
```

\begcenter starts the centering mode. It opens a group and does setting. User must use paired \endcenter in order to close this group. The \centeringmode status is checked by \encenter because curious error (about # character) should be occur without this checking.

```
op-bible.opm

301
```

# 5 Printing verses from .txs files

When Bible text is processed then book mark is saved to  $\colon colon c$ 

The \processverse  $\langle full\text{-}vref\rangle\langle space\rangle\langle verse\text{-}text\rangle$ \end is repeatedly processed.

op-bible.opm

```
311 \eoldef\processline#1{\processverse \currbook/#1\end}
```

\processverse  $\langle full\text{-}vref\rangle\langle space\rangle\langle verse\text{-}text\rangle$ \end does

- defines \currverse as  $\langle full\text{-}vref \rangle$ ,
- prepares \currversenum, \currchapnum from \langle full-vref \rangle,
- defines  $\forall$  as  $\langle verse\text{-}text \rangle$ ,
- processes all actions from \alist!\langle full-vref \rangle,
- if \currchapnum changed, prints new chapter by \printchap
- prints verse from \tmpb using \printverse

```
op-bible.opm
325 \newcount\chapnum
326 \def\processverse #1 #2\end{%
327
      \edef\currverse{#1}%

358
       \noindent \hangindent=\parindent \hangafter=-2 \relax}
359
```

## 6 Book titles, prefaces etc.

The macro \BookTile  $\langle b\text{-}mark \rangle$   $\langle a\text{-}mark \rangle$  { $\langle title \rangle$ } declares titles of each Bible books. The  $\langle b\text{-}mark \rangle$  is a book mark used in file names and  $\langle a\text{-}mark \rangle$  is an actual book mark used in printed text.

The mapping is done here:  $\def\btit!\langle a\text{-}mark\rangle \{\langle title\rangle\}, \def\f!\langle a\text{-}mark\rangle \{\langle b\text{-}mark\rangle\}.$ 

The macro is defined as **\outer** because we don't want to see obscure errors due to missing a space after  $\langle b\text{-}mark \rangle$  or  $\langle a\text{-}mark \rangle$ .

```
op-bible.opm 375 \outer\def\BookTitle #1 #2 #3{\sxdef{btit!#2}{#3}\sxdef{f!#2}{#1}}
```

The \BookException  $\langle a\text{-}mark \rangle$  { $\langle code \rangle$ } macro adds the  $\langle code \rangle$  to the \bex!  $\langle a\text{-}mark \rangle$  macro. It is used in\processbooks loop in the group before files are read. You can redefine some filenames or something more special here.

Macros \BookPre and \BookPost are defined similarly.

```
op-bible.opm

385 \long\def\myaddto#1#2{\ifcsname#1\endcsname

386 \gobal\ea\addto\csname#1\endcsname{#2}\else \global\sdef{#1}{#2}\fi}

388 \outer\long\def\BookPre #1 #2{\myaddto{bpr!#1}{#2}}

389 \outer\long\def\BookPost #1 #2{\myaddto{bpo!#1}{#2}}
```

# 7 Processing books of the Bible

The \processbooks macro does two loops over all \printedbooks. The \printedbooks list can or cannot be finalized by a space. The first loop body sets \pbook! $\langle a\text{-}mark \rangle$  used for hyperlinks. The second loop body does:

- Defines \bmark as  $\langle b\text{-}mark \rangle$  (a mark of the book used in file names)
- Defines  $\ark$ as  $\ark$ as  $\ark$ ark  $\ark$ ark  $\ark$ ark of the book used in text)
- Defines \btit as the book title.
- Calls  $\langle a-mark \rangle$  in order to set something extra.
- Calls  $\BibleBook{\langle title \rangle}{\langle a\text{-}mark \rangle}$
- Prints title of the book to the terminal and to the log.
- Inputs format definition file.
- Inputs notes file.
- Calls \bpr! $\langle a\text{-}mark \rangle$  in order to print a preface of the book,
- Inputs txs file with original text of the Bible using \bibleinput, i.e. prints the text.
- Calls \bpo! $\langle a\text{-}mark \rangle$  in order to print a closing text of the book.

op-bible.opm

454 }
```

Note that each book of the Bible is processed in the group. It means that all data from notes, formats etc. are stored in the memory only temporary for processing single book. After the Book is finalized, the  $T_{\rm F}X$  memory is freed.

### 8 Bible references

```
We prepare temporary macros first. 
\isspacein \langle text \rangle \iftrue is true if \langle text \rangle includes a space. 
\iscolonin \langle text \rangle-\iftrue is true if \langle text \rangle includes a colon. 
\isdivisin \langle text \rangle-\iftrue is true if \langle text \rangle includes a divis.
```

op-bible.opm

The  $\lt$  will be set to active as character equivalent to the macro \bref $\langle text \rangle \gt$ . This macro does all job with the hyperlinks. Fist of all, it scans the parts of the  $\langle text \rangle$  and saves them to

- \ltextP ... the text before a link specification (given in "...")
- \ltextB ... the book mark followed by ~
- \ltextC ... the chapter number followed by :

470 \def\isspacein #1 #2\iffrue{\isempty{#2}\iffalse} 471 \def\iscolonin #1:#2\iffrue{\isempty{#2}\iffalse} 472 \def\isdivisin #1-#2\iffrue{\isempty{#2}\iffalse}

- ullet \lambda \textV ... the verse number
- \ltextS ... sub-verse identifier (a if there is a verse 4a)
- \ltextF ... the -- if the  $\langle from \rangle \langle to \rangle$  format is given
- \ltextN ... the  $\langle to \rangle$  part from the  $\langle from \rangle \langle to \rangle$  format.

All these macros above can be empty if the appropriate part of the scanned  $\langle text \rangle$  is missing. The \linkpre macro includes v if it is verse link, includes n if it is note link and g if it is gloss link. These macros will be converted due to \renum data (if needed) and printed by \linktext.

```

### 10 Inserting notes to the page

We declare new insert \noteins used in the \output routine.

```
824 \newinsert \noteins
825 \skip\noteins=\bigskipamount
826 \count\noteins=500
827 \dimen\noteins=\maxdimen

828 \newinsert \noteins
829 \dimen\noteins=\maxdimen

829 \newinsert \noteins
820 \dimen\noteins=\maxdimen

820 \dimen\noteins=\maxdimen

821 \dimen\noteins=\maxdimen

822 \dimen\noteins=\maxdimen
```

The \noteinsert  $\{\langle text \rangle\}$  inserts its parameter to the \noteins. We open the \insert and set basic parameters using \noteset. Then the empty box with strut height is inserted in vertical mode (in order to consecutive notes have good baselineskip between them). Then the  $\langle text \rangle$  is printed and the paragraph is finalized. The empty box with strut depth is appended after the paragraph (in order to the same reason). Final \penalty0 allows breaking between notes.

```
op-bible.opm
840 \def\noteinsert #1{\insert\noteins{%
841
      \vbox to\ht\_strutbox{}\nobreak \vskip-\baselineskip

853
      \everypar{}
854 }
```

We add macros for inserting two columns of notes from \noteins into the page. First, we add \noterule with the space given by \skip\noteins. The \noteins material is prefixed by \penalty0 (in order to allow the next \vsplit operation) and the \vfil is added (in order to the case when the second column is smaller than the first one). The \splittopskip is set and first \vsplit toOpt adds skip given by \splittopskip to the \noteins. The \\_balancecolumns from OpTEX for splitting to two columns is used. We need to set \\_Ncols, \\_dimen0 and \\_box6 before running \\_balancecolumns. We need to insert \vskip\splittopskip because \\_balancecolumns supposes that the typesetting point resides at the first baseline of the columns.

The final \vskip does "raggedbottom". We need to add 1fill1 in order to suppress the \vfill from the \end algorithm. We add minus6pt because the height of two columns can be by half-line higher than the insertion algorithm excepts (in the case with odd lines before splitting to the two columns).

```
op-bible.opm
875 \addto\_pagecontents{%
876
      \ifvoid\noteins \else
