OP-Bible – Technical Documentation

The code of the op-bible.opm macro file is described here.

```
op-bible.opm
3 \_codedecl \processbooks {OpBible: macros for creating annotated Bible}
```

1 Preparatory work

Loading packages.

```

54 \_def\.headfont{\.Biblon\_setfontsize{at10pt}\_rm}
55 \_nsprivate \Biblon;
```

Auxiliary macros. \.printwarn {\langle text\rangle} prints warning. \.sedef {\langle name\rangle} {\langle body\rangle} is expanded \sdef. \.myaddto {\langle macro-name\rangle} {\langle text\rangle} adds \langle text\rangle to \langle macro-name\rangle globally. Moeower it defines the undefined macro by \sdef {\langle macro-name\rangle} {\langle text\rangle}.

```
op-bible.opm

65 \_let\.printwarn=\_opwarning

66 \_def \.sedef #1{\_ea\_edef \_csname#1\_endcsname}

67 \_long\_def\.myaddto#1#2{\_ifcsname#1\_endcsname

68 \_gobal\_ea\_addto\_csname#1\_endcsname{#2}\_else \_global\_sdef{#1}{#2}\_fi}
```

We prepare expandable if-macros:

\.isspacein $\langle text \rangle$ _iftrue is true if $\langle text \rangle$ includes a space.

```
\.iscolonin \langle text\rangle:\_iftrue is true if \langle text\rangle includes a colon.
\.isdivisin \langle text\rangle -\_iftrue is true if \langle text\rangle includes a divis.

op-bible.opm

77 \_def\.isspacein #1 #2\_iftrue{\_isempty{#2}\_iffalse}
78 \_def\.iscolonin #1:#2\_iftrue{\_isempty{#2}\_iffalse}
79 \_def\.isdivisin #1-#2\_iftrue{\_isempty{#2}\_iffalse}
```

2 The main loop over Bible books

The \processbooks macro does two loops over all marks in \printedbooks. The macro \printedbooks is a list of $\langle a\text{-}marks \rangle$ of Bible books separated by spaces and it must be defined in the main file. The _useit trick is used here in order we want to add $\langle space \rangle$ {} at the end of the expanded \printedbooks. The first loop body sets \pbook! $\langle a\text{-}mark \rangle$ used for hyperlinks. The second loop body does:

- Defines $\langle a-mark \rangle$ (an actual mark of the book used in the text).
- Defines \bmark as $\langle b\text{-}mark \rangle$ (a mark of the book used in file names).
- Defines \.btit as the book title.
- Saves $\langle a\text{-}mark \rangle$ to the \.currbook macro.
- Calls \.newbook{ $\langle a\text{-}mark \rangle$ }
- Prints title of the book to the terminal and to the log.
- Calls \bex!<a-mark> in order to apply the \BookException data.
- Inputs introduction file if it exists. The real \input and formatin of the introduction text is done by the \.printintro macro.
- Inputs format definition file if it exists. Information is saved to the TEX memory.
- Inputs notes file if it exists. The notes are saved to the TFX memory.
- Calls \bpr!<a-mark> in order to apply the \BookPre data.
- Inputs txs file with original text of the Bible using \.bibleinput, i.e. prints the text from txs file with notes from the TFX memory.
- Calls \bpo!<a-mark> in order to apply \BookPost data.

Note that the macros \introfile, \fmtfile, and \notesfile give the location of aprropriate files and these macros must be defined by the user in the main file.

Note2: each book of the Bible is processed in the group. It means that all data from notes, formats etc. are stored in the memory only temporary for processing single book. After the Book is finalized, the TEX memory is freed.

186
      }
187 }
188 \_def\bibname{}
```

We want <Fm 4> to be a link to Fm/1:4 because it is a single-chapter book. Compare <Gn 4> which is a link to Gn/4:1. There is a list of single-chapter books \nochapbooks. User must define it. The marks of these single-chapter books are separated by spaces here. The first and the last space are added to the \nochapbooks macro because we need them in \.brefBookChapter. The \.checknochapbooks macro does it, moreower, it checks if the \nochapbooks is defined. If not, it prints warning.

```
op-bible.opm

201 \_def\.checknochapbooks {%

202 \_ifx\nochapbooks\_undefined

203 \.printwarn{\_noexpand\nochapbooks (boks without chapters) undefined.}%

204 \_def\nochapbooks{}%

205 \_else \_edef\nochapbooks{\_space\nochapbooks\_space}\_fi

206 }
```

3 Book titles

The macro \BookTile $\langle a\text{-}mark \rangle$ $\langle b\text{-}mark \rangle$ { $\langle title \rangle$ } declares titles of each Bible books. The $\langle a\text{-}mark \rangle$ is an actual book mark used in printed text. The $\langle b\text{-}mark \rangle$ can be used in file names as \bmark. The mapping is done here: \def\btit!\langle a\mark\langle \langle title\rangle \rangle, \def\bf!\langle a\mark\rangle \langle \langle b\mark\rangle \rangle \langle b\mark\rangle \langle \langle a\mark\rangle \langle \langle b\mark\rangle \langle \langle \langle b\mark\rangle \langle b\mark\rangle \langle \langle \langle b\mark\rangle \langle \langle

The macro is defined as **\outer** because we don't want to see obscure errors due to missing a space after $\langle b\text{-}mark \rangle$ or $\langle a\text{-}mark \rangle$.

The \BookException $\langle a\text{-}mark \rangle$ { $\langle code \rangle$ } macro adds the $\langle code \rangle$ to the \bex! $\langle a\text{-}mark \rangle$ macro. It is used in \processbooks loop in the group before files are read. You can redefine some filenames or something more special here.

Macros \BookPre $\langle a\text{-}mark \rangle$ { $\langle code \rangle$ } and \BookPost $\langle a\text{-}mark \rangle$ { $\langle code \rangle$ } are defined similarly. They add $\langle code \rangle$ to the \bpr! $\langle a\text{-}mark \rangle$ and to the \bpo! $\langle a\text{-}mark \rangle$ macros repectively.

```
op-bible.opm
```

```
235 \_outer\_long\_def\.BookException #1 #2{\.myaddto{bex!#1}{#2}}
236 \_outer\_long\_def\.BookPre #1 #2{\.myaddto{bpr!#1}{#2}}
237 \_outer\_long\_def\.BookPost #1 #2{\.myaddto{bpo!#1}{#2}}
238
239 \_nspublic \BookTitle \BookException \BookPre \BookPost;
```

The \ChapterPre{ $\langle code \rangle$ } and \ChapterPost{ $\langle code \rangle$ } inserts $\langle code \rangle$ before each chapter and after each chapter. The $\langle data \rangle$ are the same for each chapter, it does not vary depending on the Book or Chapter number.

```
op-bible.opm

247 \_long\_def\.ChapterPre #1{\_def\.chapbefore{#1}}

248 \_long\_def\.ChapterPost #1{\_def\.chapafter{#1}}

249

250 %\_outer\_def\ChapterPre {\.ChapterPre}

251 %\_outer\_def\ChapterPost {\.ChapterPost} % be done at the end of this file
```

4 Actions

We create the output in two steps. First step: the data from $\$ note etc. are read and saved to the T_EX memory. For each such data element the "action" is registered to a list of actions of the given verse. Each Bible verse has its list of actions. The second step: the Bible verses are read from a .txs file and all appropriate actions (registered to this verse) are processed before the verse text is printed. These actions can modify the selected parts of the verse text.

\alist! $\langle full\text{-}vref \rangle$ is the list of actions associated with the verse $\langle full\text{-}vref \rangle$. The $\langle full\text{-}vref \rangle$ is full reference to the verse in the format $\langle book\text{-}mark \rangle / \langle chapter\text{-}num \rangle$: $\langle verse\text{-}num \rangle$

\.newaction{ $\langle full-vref \rangle$ }{ $\langle action-body \rangle$ } allocates new action.

```
op-bible.opm
271 \_def\.newaction#1#2{%
272 \_unless\_ifcsname alist!#1\_endcsname \_sdef{alist!#1}{}\_fi
273 \_ea\_addto\_csname alist!#1\_endcsname{#2}%
274 }
```

A typical "action" is \.replpre. The actions are processed for each Bible verse when the verse text is saved to the \.buff macro. The \.buff macro is processed after all actions of given verse are done. \.replpre{\langle prefix\rangle} {\langle text\rangle} {\langle text\rangle} \rangle {\langle text\rangle} \rangle {\langle text\rangle} \rangle \text\rangle \rangle text\rangle \rangle \text\rangle \rangle \text\rangle \rangle text\rangle \rangle \rangle \rangle text\rangle \rangle \rangle \rangle text\rangle \rangle \rangl

```
op-bible.opm
287 \_def\.replpre#1#2#3{%
                                            \final parameters a parameter of the properties of the propertie

311 }%

312 \_def\.replsave##1#1\_end{\_def\.buff{##1}}%

313 \_ea\.replpostdo\.buff#1\_end

314 }
```

5 The \Note macro

The first parameter of the \Note macro is $\langle gen\text{-}vref \rangle$. It is generalized reference to the Bible verse. It can be $\langle chapter\text{-}num \rangle$: $\langle verse \rangle$ (the $\langle book\text{-}mark \rangle$ is appended from the \.currbook macro) or $\langle chapter\text{-}num \rangle$: $\langle verse\text{-}from \rangle$ - $\langle verse\text{-}to \rangle$ (only $\langle verse\text{-}from \rangle$ is used for generating $\langle gen\text{-}vref \rangle$.\.\text{\congruence} \text{\congruence} \text{

```
op-bible.opm
329 \_def\.gentovref#1{\.currbook/\.gentovrefA#1-\end}
330 \_def\.gentovrefA#1-#2\end{#1}
```

\.renumvref $\langle full\text{-}vref\rangle$ _relax does re-calculating of $\langle full\text{-}vref\rangle$ using \renum data.

```
op-bible.opm
```

```
337 \_def\.renumvref #1/#2\_relax{#1/\_trycs{rn!\tmark!#1/#2}{#2}}
```

The $\langle word \rangle$ given as a parameter of the \Note macro (see bellow) is used as a word phrase which should be be searched in the given verse text. This parameter $\langle word \rangle$ is transformed first by expansion of \.transformword{\langle word \rangle} to the \langle tword \rangle variant and the \langle tword \rangle is actually used for searching. The \.transformword{\langle word \rangle} expands to the variant of the \langle word \rangle declared by \.vdef. If not declared then it expands to the \langle word \rangle itself, i.e \langle tword \rangle is equal to \langle word \rangle in this case.

```
op-bible.opm

348 \_def\.transformword#1{%

349 \_ifcsname v!\tmark!#1\_endcsname \_lastnamedcs

350 \_else #1\_fi

351 }
```

\Note $\langle gen\text{-}vref \rangle \langle space \rangle \{\langle word \rangle\} \langle text \rangle \text{ par transforms } \langle word \rangle \text{ to the } \langle tword \rangle \text{ (see above), saves } \langle text \rangle \text{ and activates replace-action of } \langle tword \rangle \text{ to } \backslash \text{doNote} \{\langle note\text{-}num \rangle\} \{\langle tword \rangle\} \text{ in given verse.}$

There is an alternative syntax $\ensuremath{\mbox{Note}\mbox{\tt gen-vref}\mbox{\tt}} \langle space\rangle \{\langle word\rangle\}=\{\langle pword\rangle\} \langle text\rangle \\ \ensuremath{\mbox{\tt length}} \ensurema$

The \ww can precede \Note. If it is true then the $\langle word \rangle$ is prepared in \nextww and $\langle pword \rangle$ is in \nextwwA. Otherwise, the macros \nextww and \nextww are undefined.

\Note does exactly following:

- Calculates $\langle full\text{-}vref\rangle$ using \.gentovref{ $\langle genv\text{-}ref\rangle$ } and svese it to \.fullvref.
- If the verse number of $\langle full\text{-}vref\rangle$ is zero, we want to insert the note-text before the chapter. This is one by the \.NoteB macro.
- Allocates new $\langle note-num \rangle$, i.e. \.\ \text{.notenum} is $\langle note-num \rangle$.
- Uses \.nextww and \.nextwwA as $\langle tword \rangle$ and $\langle pword \rangle$ if they are defined.
- Otherwise transforms $\langle word \rangle$ to $\langle tword \rangle$ by \.transformword.
- Reads $\langle pword \rangle$ (word to be printed in the note) by \.NoteA if the alternative syntax with ={ $\langle pword \rangle$ } is used. Else $\langle pword \rangle$ is equal to $\langle tword \rangle$. Use it only if \.nextww is undefined.
- Defines \notetext! $\langle note-num \rangle$ as $\langle text \rangle$.
- Defines $\noteref! \langle note-num \rangle$ as $\langle full-vref \rangle$ re-calllated by $\noteref!$
- Defines \notepre! $\langle note-num \rangle$ as numeric part of modified $\langle full-vref \rangle$. and calculates $\langle from \rangle \langle to \rangle$ part (if exists in $\langle gen-vref \rangle$) using \.renumlabel macro. This is printed prefix of the \Note.
- Defines \pword! $\langle note-num \rangle$ as $\langle pword \rangle$,
- Does \.newaction{ $\langle full\text{-}vref\rangle$ }{\.replpre{\.doNote} $\langle note\text{-}num\rangle$ }} { $\langle tword\rangle$ }{\.notefail{ $\langle note\text{-}num\rangle$ }}}.

This is done by \.AddNote{ $\langle full\text{-}vref\rangle$ }{ $\langle note\text{-}num\rangle$ }{ $\langle tword\rangle$ }.

Note that \Note is defined as \outer in order to report correctly typical mistakes with missing empty line the text of a previous \Note.

```

\.renumlabel \langle full-vref _relax expands to the numeric part of \langle full-vref \rangle and appends the $--\langle to \rangle$ part if the \.tmp macro is in the format $\langle chapter \rangle$: $\langle from \rangle - \langle to \rangle$. The $\langle to \rangle$ part is re-calculated in order to the the number of verses between $\langle from \rangle$ and $\langle to \rangle$ be kept. If the $\langle to \rangle$ part is in the format $\langle chapter \rangle$: $\langle verse \rangle$ then it is unchanged. The \.renumlabel macro must be expandable, so we cannot use \isinlist and we prepare special expandable macros \.isdivisin and \.iscolonin.

```
op-bible.opm

470 }
```

The \Note text is processed and printed in the second step, when the .txs file is read. Actions are assigned to each verse and they are run before the appropriate verse is printed. And \Note action says:

```
\.replpre{\.doNote{<note-num>}}{<tword>}{\.notefail{<note-num>}}
```

It means that the $\langle tword \rangle$ is searched in the verse text and replaced by $\.doNote{\langle note-num \rangle} {\langle tword \rangle}$. If $\langle tword \rangle$ is not found then $\.notefail{\langle note-num \rangle}$ prints warning about it and $\.doNote{\langle note-num \rangle}$ } is prefixed before the verse text.

```
op-bible.opm

485 \_def\.notefail#1{%

486 \.printwarn{\_csstring\\Note: \.currverse: The text "\_unexpanded\_ea{\.text}" not found}%

487 \.replpre{\.doNote{#1}}{}}% \Note is registered with the beginning of the verse

488 }
```

The \.doNote{ $\langle note-num \rangle$ }{ $\langle tword \rangle$ } prints the real note text in the second step, when the verse text from \.buff is processed.

The $\langle chapter \rangle$: $\langle verse \rangle$ is printed from \notepre! only if it differs from previous one, i.e. from \notepre\notepre. The $\langle pword \rangle$ is printed with uppercase first letter by \underline{uppercase} and with appended dot, but the dot is not printed if the $\langle pword \rangle$ ends by ? or !.

op-bible.opm 500 _def\.prevnotepre{} 501 _def\.doNote#1#2{% _edef\.tmpb{_cs{notepre!#1}}% 503 504 {_bf _ifx\.prevnotepre\.tmpb _else \.tmpb _enskip _glet\.prevnotepre=\.tmpb _fi 505 \.trymakedest{n:\ cs{noteref!#1}}% 506 _edef\.tmpb{_csname pword!#1_endcsname}% 507 _ifx\.tmpb_empty _else 508 509 _addto\.tmpb{.}\.punctpword _ea\.upcasefirst \.tmpb_space 510 511 _fi }% end of \bf 512 _cs{notetext!#1}}% 513 514 {\notecolor#2}% 515 } 516 _def_printfnotemark{} 517 \ def\ textindent#1{\ noindent}

The $\langle pword \rangle$ is typically all lowercase. But we want to capitalize the first letter of the $\langle pword \rangle$ when printing by \underline{\text{upcasefirst}}. You can say \let\underline{\text{upcasefirst}} elax if you don't want this feature.

```
op-bible.opm
527 \_def\.upcasefirst #1{\_uppercase{#1}}
```

The dot is added to $\langle pword \rangle$ when it is printed. But if $\langle pword \rangle$ ends by ! or ? then the added dot is uggly. We have to correct it in the \.punctpword macro. Note that $\langle pword \rangle$ is saved to \.tmpb.

```
op-bible.opm
535 \_def\.punctpword{\_replstring\.tmpb{!.}{!}\_replstring\.tmpb{?.}{?}}
```

```
546 \ def\.doCNote #1{%

```

\.reducetword does nothing by default. But \megrednotes re-defines it, so all \Notes are referenced to the beginning of the verse and nothing is searched. The \Notes with the same verse are merged in this case using \.doCNote.

```
op-bible.opm

571 \_def\.reducetword{}

572 \_def\.mergednotes{\_def\.reducetword{\_def\.tword{}}}

573 \_nspublic \mergednotes ;
```

Because there is asynchronous processing of the \Note text, we have a problem when an error occurs here. We cannot reference to appropriate line where the \Note is written. So, we print the parameters

of processed \Note to the log file. The user can look into this file and the last printed \Note parameters here refers probably to the \Note where the reason of the error is.

The logging is done by $\. notelog{\langle text \rangle}$. It is \w by default but you can set it to \i wterm.

```
op-bible.opm
586 \_let\.notelog=\_wlog
```

6 Inserting data from format files

```
\fmtpre \{\langle gen-vref\}\{\langle what\}\ \adds \langle what\\ \to \.fmtprebuff, i.e. at the beginning of the verse. \fmtadd \{\langle gen-vref\}\{\langle what\}\ \adds \langle what\\ \to \.buff, i.e. at the end of the verse. \fmtins \{\langle gen-vref\}\{\langle text\}\{\langle what\}\ \adds \langle what\\ \adds \langle what\\ \adds \adds \langle what\\ \adds \adds \langle what\\ \adds \adds \adds \langle what\\ \adds \add
```

All these commands allocate new action using \.newaction.

```

7 Printing verses from .txs files

When Bible text is processed then book mark is saved to \.currbook and each input line is separated to the $\langle chapter-num \rangle$: $\langle verse-num \rangle$ and $\langle verse-text \rangle$.

The \.processline $\langle chapter \rangle$: $\langle verse \rangle \langle space \rangle \langle verse-text \rangle$ ^J is repeatedly processed.

```
op-bible.opm
642 \_eoldef\.processline#1{\.processverse \.currbook/#1\_end}
```

\.processverse $\langle full\text{-}vref\rangle\langle space\rangle\langle verse\text{-}text\rangle\setminus$ _end does

- defines \.currverse as \langle full-vref \rangle,
- prepares \.currversenum, \.currversetext, \.currchapnum from \langle full-vref \rangle,
- defines \.buff as \langle verse-text \rangle,
- processes all actions from \alist!\langle full-vref \rangle,
- if \.currchapnum changed, prints \.chapafter (for previous chapter) and \.chapbefore (for new chapter).
- prints verse from \.buff using \.printverse

op-bible.opm

8 Bible references

The \lt will be set to active as character equivalent to the macro \backslash .bref $\langle text \rangle \gt$. This macro does all job with the hyperlinks. Fist of all, it scans the parts of the $\langle text \rangle$ and saves them to

```
\.ltextP ... the text before a link specification (given in "...")
\.ltextB ... the book mark followed by ~
\.ltextC ... the chapter number followed by :
\.ltextV ... the verse number
\.ltextS ... sub-verse identifier (a if there is a verse 4a)
\.ltextF ... the -- if the ⟨from⟩-⟨to⟩ format is given
\.ltextN ... the ⟨to⟩ part from the ⟨from⟩-⟨to⟩ format.
```

All these macros above can be empty if the appropriate part of the scanned $\langle text \rangle$ is missing. The \lambda.linkpre macro includes v if it is verse link, includes n if it is note link and g if it is gloss link. These macros will be converted due to \renum data (if needed) and printed by \lambda.linktext.

851 \_def\.oncebref{}

852 \_nspublic \everybref;
```

Macro \.brefL recalculates \.linkfspec and \.linktext due to \renum data and creates the link \.linkpre:\.linkfspec with the text \.linktext.

 $\. renumlinktext \langle full-vref-ori\rangle _ relax \langle full-vref-modified\rangle _ relax does re-calculation of the parts of the \.linktext macro.$

The \.linkfspecone solves situation when chapter is given but no verse number: we must set the verse number to 1.

If the link destination is article, then the $\langle full\text{-}vref\rangle$ has reduced format $\langle book\rangle/\langle chapter\rangle$. If the link destination is itroduction then the $\langle full\text{-}vref\rangle$ has more reduced format: $\langle book\rangle/\langle chapter\rangle$.

If the book mark is declared by \vdef then the printed version of the book mark is transformed depending on the current \tmark. This is done by the the \.newlinkB macro.

\.linklog $\{\langle text \rangle\}$ macro prints logging info of the link in the format

```
\langle (link\text{-}spec) \rangle = [\langle full\text{-}vref \rangle] \{\langle printed\text{-}link \rangle\}
```

\.linklog is \wlog by default and when \tracinglinks is set. It is \ignreit when \notracinglinks is set. You can set it to \wterm if you want.

```

We don't create destinations for all verses, notes etc. but only for those which are referenced. The macro \.ensuredest is called from \.createlink and it saves immediatelly \sdef{\langle link}:\langle full-vref\rangle}{\langle}\$ to the special file \jobname.xrf. And the macro \pg saves immediatelly \sdef{pg:\langle link}:\langle full-vref\rangle}{\langle rull-vref\rangle}\$ to this file. This .xrf file is read before standard .ref file. All link destinations save \.Xdest{\langle full-vref\rangle}\$ to the .ref file. The macro \.Xdest does nothing if \pg:\langle link\rangle:\langle full-vref\rangle\$ is not defined (from .xrf file). Otherwise, it is defined as a correct pageno. This result is used in the \pg macro. If \langle link\rangle:\langle full-vref\rangle\$ is not defined, no link destination is crated. First TeX run creates .ref and .xrf files and does not create any hyperlink destinations. Second TeX run uses data from these files and creates correct hyperlinks and page numbers.

```

The \switch macro reads a pair of parameters using \.switchA and processes the list of variants in \foreach loop. If an element from the list is equal with \tmark then the #2 (saved in \.switchD token list) is run and next parameter pairs are read by \.switchN, i.e. they are ignored.

The \Note and \ww and more macros are defined as \outer in order to better diagnose mistakes with their parameters. But we want to skip such objects in \switch parameters. This is the reason why we set _suppressoutererror=1 during the \switch is processed.

```

10 Inserting notes to the page

We declare new insert \.noteins used in the \output routine.

```
op-bible.opm

1176 \_newinsert \.noteins

1177 \_skip\.noteins=\_bigskipamount  % noterule height

1178 \_count\.noteins=500  % two columns

1179 \_dimen\.noteins=\_maxdimen  % full page of notes allowed
```

The \.noteinsert $\{\langle text \rangle\}$ inserts its parameter to the \.noteins. We open the \insert and set basic parameters using \.noteset. Then the empty box with strut height is inserted in vertical mode (in order to consecutive notes have good baselineskip between them). Then the $\langle text \rangle$ is printed and the paragraph is finalized. The empty box with strut depth is appended after the paragraph (in order to the same reason). Final \penalty0 allows breaking between notes.

```
op-bible.opm

       \_everypar{}
```

We add macros for inserting two columns of notes from \.noteins into the page. First, we add \noterule with the space given by \skip\.noteins. The \.noteins material is prefixed by \penalty0 (in order to allow the next \vsplit operation) and the \vfil is added (in order to the case when the second column is smaller than the first one). The \splittopskip is set and first \vsplit toOpt adds skip given by \splittopskip to the \.noteins. The _balancecolumns from OpTeX for splitting to two columns is used. We need to set _Ncols, _dimenO and _box6 before running _balancecolumns. We need to insert \vskip\splittopskip because _balancecolumns supposes that the typesetting point resides at the first baseline of the columns.

The final \vskip does "raggedbottom". We need to add 1fill1 in order to suppress the \vfill from

the \end algorithm. We add minus6pt because the height of two columns can be by half-line higher than the insertion algorithm excepts (in the case with odd lines before splitting to the two columns).

\putArticle \(\chinor{chapter} \: \langle verse \rangle \{\langle title \rangle \} \[\langle label \rangle \] (\(\langle params \rangle \)) inserts an article given in the file articles-*.tex signed by \(\text{Article} \[\langle label \rangle \]. The article starts at the page where \(\chinor{chapter} \: \langle verse \rangle \) is

or at the next page. The article is in two-columns style and it is divided to k two-columns parts each of them is inserted at the bottom of the next page.

We calculate the number of pages used for article text by following rules. All the two-columns parts have the same height. If there are more than one such a part, the height does not exceeds 2/3 of the page. But single two-column part can be higher.

\putArticle registers \.doArticle using \.newaction. \.doArticle is run at the beginning of given verse and creates an \.botisert. The insert material is breakable at its beginig and between each two-column boxes created by the _balancecolumn macro.

We register a new action by \.newaction{ $\langle full-vref \rangle$ }{\.doArticle{ $\langle title \rangle$ }[$\langle label \rangle$]($\langle params \rangle$)}.

12 Inserting citations to the page

\putCite $\langle gen\text{-}vref \rangle$ { $\langle text \rangle$ } creates a citation $\langle text \rangle$ inserted to the top of the page where the verse $\langle gen\text{-}vref \rangle$ is. We regiter a new action by \.newaction{ $\langle full\text{-}vref \rangle$ }{\dotopCite{ $\langle text \rangle$ }}.

```

1398 }

1399 \_nspublic \putCite ;
```

\.dotopCite $\{\langle text \rangle\}$ creates the citation text by \topinsert...\endinsert form plain TeX. We distinguish two cases: the citation on a left page and the citation on a right page. We sawe the page position using _ewref to the .ref file as \sxdef{ct!\citenum\}{\lambda}.mypage} and we know the page position in the second TeX run and use it in the \ifodd condition. The typesetting parameters differ in "left" and "right" case.

The \.lqqbox and \.rqqbox include the graphical marks for quotations. First one is used at the left pages, second one at the right pages.

The macro $\quotedby{\langle author\rangle}$ puts the author of the quatation to the next line. The macro \quotedbyright (which is used at left pages) prints the $\langle author\rangle$ at the last line if there is sufficient space.
