68 \_gobal\_ea\_addto\_csname#1\_endcsname{#2}\_else \_global\_sdef{#1}{#2}\_fi}
```

### 2 The main loop over Bible books

The \processbooks macro does two loops over all marks in \printedbooks. The macro \printedbooks is a list of  $\langle a\text{-}marks \rangle$  of Bible books separated by spaces and it must be defined in the main file. The \\_useit trick is used here in order we want to add  $\langle space \rangle$ {} at the end of the expanded \printedbooks. The first loop body sets \pbook!  $\langle a\text{-}mark \rangle$  used for hyperlinks. The second loop body does:

- Defines  $\backslash$ amark as  $\langle a\text{-}mark \rangle$  (an actual mark of the book used in the text).
- Defines  $\backslash bmark$  as  $\langle b-mark \rangle$  (a mark of the book used in file names).
- Defines \.btit as the book title.
- Calls \.newbook{\langle a-mark\rangle}
- Prints title of the book to the terminal and to the log.
- Calls \bex!<a-mark> in order to apply the \BookException data.
- Inputs introduction file if it exists. The real \input and formatin of the introduction text is done by the \.printintro macro.
- Inputs format definition file if it exists. Information is saved to the TeX memory.
- Inputs notes file if it exists. The notes are saved to the TFX memory.
- Calls \bpr!<a-mark> in order to apply the \BookPre data.
- Inputs txs file with original text of the Bible using \.bibleinput, i.e. prints the text from txs file with notes from the TFX memory.
- Calls \bpo!<a-mark> in order to apply \BookPost data.

Note that the macros \introfile, \fmtfile, and \notesfile give the location of aprropriate files and these macros must be defined by the user in the main file.

Note2: each book of the Bible is processed in the group. It means that all data from notes, formats etc. are stored in the memory only temporary for processing single book. After the Book is finalized, the TEX memory is freed.

We want <Fm 4> to be a link to Fm/1:4 because it is a single-chapter book. Compare <Gn 4> which is a link to Gn/4:1. There is a list of single-chapter books \nochapbooks. User must define it. The marks of these single-chapter books are separated by spaces here. The first and the last space are added to the \nochapbooks macro because we need them in \.brefBookChapter. The \.checknochapbooks macro does it, moreower, it checks if the \nochapbooks is defined. If not, it prints warning.

```
op-bible.opm

186 \_def\.checknochapbooks {%

187 \_ifx\nochapbooks\_undefined

188 \.printwarn{\_noexpand\nochapbooks (boks without chapters) undefined.}%

190 \_else \_edef\nochapbooks{\_space\nochapbooks\_space}\_fi

191 }
```

#### 3 Book titles

The macro \BookTile  $\langle a\text{-}mark \rangle$   $\langle b\text{-}mark \rangle$  {\langle title}\rangle declares titles of each Bible books. The  $\langle a\text{-}mark \rangle$  is an actual book mark used in printed text. The  $\langle b\text{-}mark \rangle$  can be used in file names as \bmark. The mapping is done here: \\def\\btit!\langle a\mark \rangle \langle title \rangle \rangle, \\def\\btit!\langle a\mark \rangle \langle \langle title \rangle \rangle \rangle \text{-}mark \rangle \langle \langle title \rangle \rangle \rangle \text{-}mark \rangle \langle \langle \rangle t\text{-}mark \rangle \langle \langle \rangle \text{-}mark \rangle \langle \langle \text{-}mark \rangle \langle \langle \text{-}mark \rangle \langle \langle \rangle \rangle

The macro is defined as **\outer** because we don't want to see obscure errors due to missing a space after  $\langle b\text{-}mark \rangle$  or  $\langle a\text{-}mark \rangle$ .

```
op-bible.opm 208 \_outer\_def\.BookTitle #1 #2 #3{\_sxdef{btit!#1}{#3}\_sxdef{f!#1}{#2}}
```

The \BookException  $\langle a\text{-}mark \rangle$  { $\langle code \rangle$ } macro adds the  $\langle code \rangle$  to the \bex! $\langle a\text{-}mark \rangle$  macro. It is used in \processbooks loop in the group before files are read. You can redefine some filenames or something more special here.

Macros \BookPre  $\langle a\text{-}mark \rangle$  { $\langle code \rangle$ } and \BookPost  $\langle a\text{-}mark \rangle$  { $\langle code \rangle$ } are defined similarly. They add  $\langle code \rangle$  to the \bpr! $\langle a\text{-}mark \rangle$  and to the \bpo! $\langle a\text{-}mark \rangle$  macros repectively.

```
op-bible.opm

220 \_outer\_long\_def\.BookException #1 #2{\.myaddto{bex!#1}{#2}}

221 \_outer\_long\_def\.BookPre #1 #2{\.myaddto{bpr!#1}{#2}}

222 \_outer\_long\_def\.BookPost #1 #2{\.myaddto{bpo!#1}{#2}}

223 \_nspublic \BookTitle \BookException \BookPre \BookPost ;
```

#### 4 Actions

We create the output in two steps. First step: the data from  $\$  note etc. are read and saved to the  $T_EX$  memory. For each such data element the "action" is registered to a list of actions of the given verse. Each Bible verse has its list of actions. The second step: the Bible verses are read from a .txs file and all appropriate actions (registered to this verse) are processed before the verse text is printed. These actions can modify the selected parts of the verse text.

 $\alist!\langle full\text{-}vref\rangle$  is the list of actions associated with the verse  $\langle full\text{-}vref\rangle$ . The  $\langle full\text{-}vref\rangle$  is full reference to the verse in the format  $\langle book\text{-}mark\rangle/\langle chapter\text{-}num\rangle$ : $\langle verse\text{-}num\rangle$ 

\.newaction{ $\langle full\text{-}vref\rangle$ }{ $\langle action\text{-}body\rangle$ } allocates new action.

```
op-bible.opm

244 \_def\.newaction#1#2{%

245 \_unless\_ifcsname alist!#1\_endcsname \_sdef{alist!#1}{}\_fi

246 \_ea\_addto\_csname alist!#1\_endcsname{#2}%

247 }
```

A typical "action" is \.replpre. The actions are processed for each Bible verse when the verse text is saved to the \.buff macro. The \.buff macro is processed after all actions of given verse are done. \.replpre{\langle prefix\rangle} + \langle \langle text\rangle + \langle \langle \langle text\rangle + \langle \langle

If  $\langle text \rangle$  does not exist then  $\langle fail \rangle$  is processed. The  $\langle fail \rangle$  macro can use \.text where  $\langle text \rangle$  is saved.

```
\_def\.replpre#1#2#3{%
260
261
     \_else
262
       \_def\.replpredo##1#2##2\_end{%
263
264
          \frac{1}{2} \pi^2 = \frac{1}{2} \pi^2  <fail>
          \_else \.replsave ##1#1{#2}##2\_end \_fi
265
266
       \end{\end{\end{\def}.} buff{$\#1$}}%
267
       \_ea\.replpredo\.buff#2\_end
268
269
270 }
```

#### 5 The \Note macro

The first parameter of the \Note macro is  $\langle gen\text{-}vref \rangle$ . It is generalized reference to the Bible verse. It can be  $\langle chapter\text{-}num \rangle$ :  $\langle verse \rangle$  (the  $\langle book\text{-}mark \rangle$  is appended from \CommentedBook token list) or  $\langle chapter\text{-}num \rangle$ :  $\langle verse\text{-}from \rangle$ - $\langle verse\text{-}to \rangle$  (only  $\langle verse\text{-}from \rangle$  is used for generating  $\langle gen\text{-}vref \rangle$ . \.gento\text{gento\text{ver}} \end{appended} \text{expands to } \langle full\text{-}vref \rangle.

```
op-bible.opm

284 \_newtoks\.CommentedBook

285 \_def\.gentovref#1{\the\.CommentedBook/\.gentovrefA#1-\end}

286 \_def\.gentovrefA#1-#2\end{#1}

287

288 \_nspublic \CommentedBook ;
```

\.renumvref  $\langle full\text{-}vref\rangle$ \ relax does re-calculating of  $\langle full\text{-}vref\rangle$  using \renum data.

```
op-bible.opm
294 \_def\.renumvref #1/#2\_relax{#1/\_trycs{rn!\tmark!#1/#2}{#2}}
```

The  $\langle word \rangle$  given as a parameter of the \Note macro (see bellow) is used as a word phrase which should be be searched in the given verse text. This parameter  $\langle word \rangle$  is transformed first by expansion of \.transformword{\langle word \rangle} to the \langle tword \rangle variant and the \langle tword \rangle is actually used for searching. The \.transformword{\langle word \rangle} expands to the variant of the \langle word \rangle declared by \.vdef. If not declared then it expands to the \langle word \rangle itself, i.e \langle tword \rangle is equal to \langle word \rangle in this case.

```
op-bible.opm
305 \_def\.transformword#1{%
306 \_ifcsname v!\tmark!#1\_endcsname \_lastnamedcs
307 \_else #1\_fi
308 }
```

\Note  $\langle gen\text{-}vref \rangle$   $\langle space \rangle$   $\{\langle word \rangle\}$   $\langle text \rangle$  \par transforms  $\langle word \rangle$  to the  $\langle tword \rangle$  (see above), saves  $\langle text \rangle$  and activates replace-action of  $\langle tword \rangle$  to \.doNote $\{\langle note\text{-}num \rangle\}$   $\{\langle tword \rangle\}$  in given verse. There is an alternative syntax \Note  $\langle gen\text{-}vref \rangle$   $\langle space \rangle$   $\{\langle word \rangle\}$ = $\{\langle pword \rangle\}$   $\langle text \rangle$  \par If  $\langle pword \rangle$  is

given then is is printed in the note instead  $\langle tword \rangle$ . More precisely: transformed  $\langle word \rangle$  is used for searching (and it is kept in the verse unchanged) but  $\langle pword \rangle$  is printed in the note.

The \ww can precede \Note. If it is true then the  $\langle word \rangle$  is prepared in \nextww and  $\langle pword \rangle$  is in \nextwwA. Otherwise, the macros \nextww and \nextwwA are undefined. \Note does exactly following:

- Allocates new  $\langle note\text{-}num \rangle$ ,
- Transforms  $\langle gen\text{-}vref \rangle$  to  $\langle full\text{-}vref \rangle$  using \.gentovref.
- Modifies \(\langle full-vref \rangle \) if \renum was declared using \.renumvref and saves the result to \.fullvrefm.
- Use \nextww and \nextwwA as  $\langle tword \rangle$  and  $\langle pword \rangle$  if they are defined.
- Otherwise transforms  $\langle word \rangle$  to  $\langle tword \rangle$  by \.transformword.
- Reads  $\langle pword \rangle$  (word to be printed in the note) if the alternative syntax with ={ $\langle pword \rangle$ } is used. Else  $\langle pword \rangle$  is equal to  $\langle tword \rangle$ .
- Defines \notetext!  $\langle note\text{-}num \rangle$  as  $\langle text \rangle$ .
- Defines \noteref!  $\langle note-num \rangle$  as  $\langle full-vref \rangle$ .
- Defines \notepre!  $\langle note-num \rangle$  as numeric part of modified  $\langle full\text{-}vref \rangle$  and calculates  $\langle from \rangle \langle to \rangle$  part (if exists in  $\langle gen\text{-}vref \rangle$ ) using \renumlabel macro. This is printed prefix of the \Note.
- Defines \pword!  $\langle note-num \rangle$  as  $\langle pword \rangle$ ,
- Does

 $\verb|\.newaction{| \langle full-vref \rangle } {\tt \.neplpre{\.doNote} \langle note-num \rangle }} {\tt \.notefail} {\tt \.not$

\renumlabel \langle full-vref \\\_relax expands to the numeric part of \langle full-vref \rangle and appends the  $--\langle to \rangle$  part if the \tmp macro is in the format  $\langle chapter \rangle$ :  $\langle from \rangle - \langle to \rangle$ . The  $\langle to \rangle$  part is re-calculated in order to the the number of verses between  $\langle from \rangle$  and  $\langle to \rangle$  be kept. If the  $\langle to \rangle$  part is in the format  $\langle chapter \rangle$ :  $\langle verse \rangle$  then it is unchanged. The \renumlabel macro must be expandable, so we cannot use \isinlist and we prepare special expandable macros \isidivis and \iscolon.

```
op-bible.opm

406 }
```

The \Note text is processed and printed in the second step, when the .txs file is read. Actions are assigned to each verse and they are run before the appropriate verse is printed. And \Note action says:

```
\.replpre{\.doNote{<note-num>}}{<tword>}{\.notefail{<note-num>}}
```

It means that the  $\langle tword \rangle$  is searched in the verse text and replaced by \.doNote{ $\langle note-num \rangle$ }{ $\langle tword \rangle$ }. If  $\langle tword \rangle$  is not found then \.notefail{ $\langle note-num \rangle$ } prints warning about it and \.doNote{ $\langle note-num \rangle$ }{} is prefixed before the verse text.

```
op-bible.opm

421 \_def\.notefail#1{%

422 \.printwarn{\_csstring\\Note: \.currverse: The text "\_unexpanded\_ea{\.text}" not found}%

423 \.replpre{\.doNote{#1}}{}{}% \Note is registered with the beginning of the verse

424 }
```

And the  $\dots$  doNote{(note-num)}{(tword)} prints the real note text in the second step, when the verse text from  $\begin{subarray}{l} \textbf{buff} is processed. \end{subarray}$ 

```

```

The phrase  $\{\langle word \rangle\}$  used in notes must be exactly the same as the word used in the .txs text. But we want to capitalize the first letter of the  $\langle word \rangle$  when printing. You can say \let\.upcasefirts=\relax if you don't want this feature.

```
op-bible.opm
453 \_def\.upcasefirst #1{\_uppercase{#1}}
```

Because there is asynchronous processing of the \Note text, we have a problem when an error occurs here. We cannot reference to appropriate line where the \Note is written. So, we print the parameters of processed \Note to the log file. The user can look into this file and the last printed \Note parameters here refers probably to the \Note where the reason of the error is.

The logging is done by  $\.$ notelog{(text)}. It is  $\w$  by default but you can set it to  $\i$  wterm.

```
op-bible.opm
466 \_let\.notelog=\_wlog
```

## 6 Inserting data from format files

```
\fmtpre \{\langle gen\text{-}vref\rangle\}\{\langle what\rangle\}\ adds \langle what\rangle to \.fmtprebuff, i.e. at the beginning of the verse. \fmtadd \{\langle gen\text{-}vref\rangle\}\{\langle what\rangle\}\ adds \langle what\rangle to \.buff, i.e. at the end of the verse. \fmtins \{\langle gen\text{-}vref\rangle\}\{\langle text\rangle\}\{\langle what\rangle\}\ inserts \langle what\rangle after \langle text\rangle in the verse. If \langle text\rangle is not found then
```

 $\langle what \rangle$  is inserted like \fmtpre does it

All these commands allocate new action using \.newaction.

```
op-bible.opm

### 7 Printing verses from .txs files

When Bible text is processed then book mark is saved to \.currbook and each input line is separated to the  $\langle chapter-num \rangle$ : $\langle verse-num \rangle$  and  $\langle verse-text \rangle$ .

The \processverse  $\langle full\text{-}vref\rangle\langle space\rangle\langle verse\text{-}text\rangle\setminus$ \_end is repeatedly processed.

op-bible.opm

```
^{524} \ensuremath{\lower.processline\#1{\lower.processverse \lower.proces/#1\ensuremath{\lower.process}}
```

\.processverse  $\langle full\text{-}vref\rangle\langle space\rangle\langle verse\text{-}text\rangle$ \\_end does

- defines \.currverse as \langle full-vref \rangle,
- prepares \.currversenum, \.currversetext, \.currchapnum from \langle full-vref \rangle,
- defines \.buff as  $\langle verse\text{-}text \rangle$ ,
- processes all actions from \alist!\langle full-vref \rangle,
- if \.currchapnum changed, prints new chapter by \.printchap
- prints verse from \.buff using \.printverse

op-bible.opm 538 \\_newcount\.chapnum 539 \\_def\.processverse #1 #2\\_end{% 540 \\_edef\.currverse{#1}% 541 \.preparechapverse #1 \\_let\.prelinkV=\.currversenum 542  $\ensuremath{\def\.\def\.\prebuff{}\def\.\prebuff{}\%$ 543 \\_ifx\.verseto\\_empty \\_csname alist!#1\\_endcsname \\_else 544 \\_fornum \.versefrom..\.verseto \\_do{\\_csname alist!\.currbook/\.currchapnum:##1\\_endcsname}% 545 \\_fi 546 \\_ifnum\.currchapnum=\.chapnum \\_else 547 \\_let\.prelinkC=\.currchapnum \.chapnum=\.currchapnum\\_relax \.printchap \\_fi 548 549 550 }  $551 \ensuremath{\mbox{\mbox{$\sim$}}} 41/#2:#3 {\ensuremath{\mbox{\mbox{$\sim$}}}$  $\ensuremath{\ }\$ 552  $\.$ isdivisin #3-\\_iftrue \.defversefromto #3\\_end 553 \\_else \\_def\.currversenum{#3}\\_let\.currversetext=\.currversenum

```
We prepare temporary macros first. \land includes a space. \land iscolonin \langle text \rangle: \land iftrue is true if \langle text \rangle includes a colon.
```

\.isdivisin  $\langle text \rangle$ -\\_iftrue is true if  $\langle text \rangle$  includes a divis.

```
op-bible.opm

616 \_def\.isspacein #1 #2\_iftrue{\_isempty{#2}\_iffalse}

617 \_def\.iscolonin #1:#2\_iftrue{\_isempty{#2}\_iffalse}

618 \_def\.isdivisin #1-#2\_iftrue{\_isempty{#2}\_iffalse}
```

The  $\lt$  will be set to active as character equivalent to the macro  $\backslash$ .bref $\langle text \rangle \gt$ . This macro does all job with the hyperlinks. Fist of all, it scans the parts of the  $\langle text \rangle$  and saves them to

- $\bullet$  \.ltextP ... the text before a link specification (given in "...")
- $\bullet$  \.ltextB ... the book mark followed by  $\sim$
- \.ltextC ... the chapter number followed by :
- \.ltextV ... the verse number

- \.ltextS ... sub-verse identifier (a if there is a verse 4a)
- \.ltextF ... the -- if the  $\langle from \rangle \langle to \rangle$  format is given
- \.ltextN ... the  $\langle to \rangle$  part from the  $\langle from \rangle \langle to \rangle$  format.

All these macros above can be empty if the appropriate part of the scanned  $\langle text \rangle$  is missing. The \lambda.linkpre macro includes v if it is verse link, includes n if it is note link and g if it is gloss link. These macros will be converted due to \renum data (if needed) and printed by \linktext.

```

723 \_def\.oncebref{}
724 \_nspublic \everybref;
```

Macro \.brefL recalculates \.linkfspec and \.linktext due to \renum data and creates the link \.linkpre:\.linkfspec with the text \.linktext.

 $\. renumlinktext \langle full-vref-ori\rangle \_ relax \langle full-vref-modified\rangle \_ relax does re-calculation of the parts of the \.linktext macro.$ 

The \.linkfspecone solves situation when chapter is given but no verse number: we must set the verse number to 1.

If the link destination is article, then the  $\langle full\text{-}vref\rangle$  has reduced format  $\langle book\rangle/\langle chapter\rangle$ . If the link destination is itroduction then the  $\langle full\text{-}vref\rangle$  has more reduced format:  $\langle book\rangle/$ .

\.linklog  $\{\langle text \rangle\}$  macro prints logging info of the link in the format

```
\langle (link\text{-}spec) \rangle = [\langle full\text{-}vref \rangle] \{\langle printed\text{-}link \rangle\}
```

\.linklog is \wlog by default and when \tracinglinks is set. It is \ignreit when \notracinglinks is set. You can set it to \wterm if you want.

```

 $\x/\langle phrase \rangle$  expands to  $\v!\langle tmark \rangle!\langle phrase \rangle$  if such control sequence is defined else it expands simply to  $\langle phrase \rangle$  using  $\xA$ . The  $\langle tmark \rangle$  is actual value of the  $\tmark$  macro.

Note that if  $\t expands to \langle t-markA \rangle$  (used in the  $\t expands to the <math>\t expands to the \langle phrase \rangle$  directly.

 $\xspace x = \frac{\langle phrase \rangle}{\langle phrase \rangle}$  expands to  $\langle phrase \rangle$  and prints warning, if  $\t x = \frac{\langle phrase \rangle}{\langle phrase \rangle}$ .

```

\ww { $\langle phrase-A \rangle$ } { $\langle phrase-B \rangle$ } ... has the same number of parameters as \vdef. They are separated by spaces. Each parameter can be in the "single form", i.e. { $\langle phrase-A \rangle$ } or in the "extended form", i.e. { $\langle phrase-A \rangle$ } ={ $\langle printed-A \rangle$ }. The macro searchs the correct phrase (given by the \.varnum) and saves it to the \nextww. The \nextwwA is set to \nextww if there is single form of the parameter else \nextwwA is  $\langle printed-A \rangle$  part of the parameter in the extended form. These macros are used in the next \Note where they are re-set to \undefined meaning.

The \switch macro reads a pair of parameters using \.switchA and processes the list of variants in \foreach loop. If an element from the list is equal with \tmark then the #2 (saved in \.switchD token list) is run and next parameter pairs are read by \.switchN, i.e. they are ignored.

The \Note and \ww are defined as \outer in order to better diagnose mistakes with number of parameters of \ww or missig empty line after \Note text. But we want to skip such objects in \switch parameters. This is the reason why we run \unsetouter before the \switch parameter is read and we run \setouter in order to return to the normal setting.

### 10 Inserting notes to the page

We declare new insert \.noteins used in the \output routine.

The \.noteinsert  $\{\langle text \rangle\}$  inserts its parameter to the \.noteins. We open the \insert and set basic parameters using \.noteset. Then the empty box with strut height is inserted in vertical mode (in order to consecutive notes have good baselineskip between them). Then the  $\langle text \rangle$  is printed and the paragraph is finalized. The empty box with strut depth is appended after the paragraph (in order to the same reason). Final \penalty0 allows breaking between notes.

```
op-bible.opm
1063 \ def\.noteinsert #1{\ insert\.noteins{%
1064
       \.noteset
       \_vbox to\_ht\_strutbox{}\_nobreak \_vskip-\_baselineskip
1065
       #1\_unskip\_par \_nobreak \_vskip-\_baselineskip
1066
       1067
1068
1069 }}
1070 \_def\.noteset{\Heros\cond \_scalemain \_typoscale[800/800] % Heros condensed 80%
1071
       \Black \ nobreak
       \_widowpenalty=20 \_clubpenalty=20
1072
1073

1076
1077
       \_everypar{}
1078 }
```

We add macros for inserting two columns of notes from \.noteins into the page. First, we add \noterule with the space given by \skip\.noteins. The \.noteins material is prefixed by \penalty0 (in order to allow the next \vsplit operation) and the \vfil is added (in order to the case when the second column is smaller than the first one). The \splittopskip is set and first \vsplit toOpt adds skip given by \splittopskip to the \.noteins. The \\_balancecolumns from OpTEX for splitting to two columns is used. We need to set \\_Ncols, \\_dimenO and \\_box6 before running \\_balancecolumns. We need to insert \vskip\splittopskip because \\_balancecolumns supposes that the typesetting point resides at the first baseline of the columns.

The final \vskip does "raggedbottom". We need to add 1fill1 in order to suppress the \vfill from the \end algorithm. We add minus6pt because the height of two columns can be by half-line higher than the insertion algorithm excepts (in the case with odd lines before splitting to the two columns).

```

# 12 Inserting citations to the page

\putCite  $\langle gen\text{-}vref \rangle$  { $\langle text \rangle$ } creates a citation  $\langle text \rangle$  inserted to the top of the page where the verse  $\langle gen\text{-}vref \rangle$  is. We regiter a new action by \.newaction{ $\langle full\text{-}vref \rangle$ }{\dotopCite{ $\langle text \rangle$ }}.

```

1267 \_ea\.newaction\_ea{\.fullvrefm}{\.dotopCite{#2}}%

1268 }

1269 \_nspublic \putCite ;
```

\.dotopCite  $\{\langle text \rangle\}$  creates the citation text by \topinsert...\endinsert form plain TeX. We distinguish two cases: the citation on a left page and the citation on a right page. We sawe the page position using \\_ewref to the .ref file as \sxdef{ct!}\( citenum \) \{\.mypage} and we know the page position in the second TeX run and use it in the \ifodd condition. The typesetting parameters differ in "left" and "right" case.

The \.lqqbox and \.rqqbox include the graphical marks for quotations. First one is used at the left pages, second one at the right pages.

The macro  $\quotedby{\langle author\rangle}$  puts the author of the quatation to the next line. The macro  $\quotedbyright$  (which is used at left pages) prints the  $\langle author\rangle$  at the last line if there is sufficient space.

The following macros Cite,  $\insertCite$  and  $\swapCites$  are used for insertion of citations to the two-cloumn printed articles. The  $\insertCite\langle label\rangle\{\langle text\rangle\}\$  simply saves the  $\langle text\rangle$  to the macro  $\c.!\langle article-num\rangle!\langle label\rangle$ . The  $\insertCite\langle label\rangle\langle feft-or-right\rangle$  inserts the citation declared by  $\insertCite\langle label\rangle$  to the text using  $\insertCite\langle label\rangle$ . The variant  $\insertCite\langle label\rangle$  is processed or ignored. This depends on the parity of the current page, which is restored from .ref file and saved to the macro  $\insertCite\langle label\rangle$ .

# 14 Typesetting variants

By default, chapter numbers are in the outer margin and quotes characters too. The \normalchapnums macro moves chater numbers to the left side in the first paragraph, cquotes characters are removed and outer margins are reduced because there is no material in them.
